"Cleavage of members of the synaptobrevin/VAMP family by types D and F T. Cleavage of members and tetanus toxin.";

J. Biol. Chem. 269:12764-12772(1994).

"C. -!-FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that catalyzes the hydrolysis of the 58-Gln-|-Lys-59 cordopeptidase that catalyzes the hydrolysis of the Sa-Gln-|-Lys-59 cordopeptidase that catalyzes the hydrolysis of the Sa-Gln-|-Lys-59 cordopeptidase that catalyzes the hydrolysis of the Sa-Gln-|-Lys-59 cordopeptidase that catalyzes the hydrolysis of the Sa-Gln-|-Lys-59 cordopeptidase action on small molecule substrates.

"C. -CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

"C. -COPACTOR: Binds 1 zinc ion per subunit (By similarity).

"C. -COPACTOR: Binds 1 zinc ion per subunit (By similarity).

MUCLeocide sequence of the gene coding for Clostridium botulinum

(Clostridium argentinense) type G neurotoxin: genealogical comparison

(Clostridium argentinense) type G neurotoxin: genealogical comparison

with other clostridial neurocoxine.";

1- FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter

release. It binds to peripheral neuronal synapses, is internalized

and moves by retrograde transport up the axon into the spinal cord

where it can move between postsynaptic and presynaptic neurons. It
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                    CATALTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

COFACTOR: Binds I zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STRAIN=Type A / NCTC 2916;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Clostridium botulinum.
Bacteria; Firmicutes; Clostridia; Clostridiales; Clostridiaceae;
Clostridium.
                                                                                                                                                                                                                                                                                                                                                                                                                                             formation and toxin binding, respectively.
SUBCELLULAR LOCATION: Secreted (By similarity).
MISCELLANBOUS: There are seven antigenically distinct forms botulinum neurofoxin: Types A, B, Cl, D, E, F, and G.
SIMILARITY: Belongs to peptidase family M27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DB 1; Length 1296;

heavy chain (H).

-- SUBCELLULAR LOCATION: Secreted.
-- PHARMASCEDITICAL: Available under the name BOTOX (Allergan) for the treatment of strabismus and blepharospasm associated with dystonia and cervical dystonia. Also used for the treatment of hemifacial spasm and a number of other neurological disorders characterized by abnormal muscle contraction.
-- MISCELLANBOUS: There are seven antigenically distinct forms of botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.
-- SIMILARITY: Belongs to peptidase family M27.
-- SIMILARITY: Belongs to peptidase family M27.

Struct. Biol. 5:898-902(1998).

-!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin binds with high affinity to peripheral neuronal presynaptic membrane, is then internalized by receptor-mediated endocytosis. The C-terminus of the heavy chain (H) is responsible for the adherence of the toxin to the cell surface while the N-terminus mediates transport of the light chain from the endocytic vesicle to the cytosol. After translocation, the light chain (L) hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking neurotransmitter release. Inhibition of acetylcholine release results in flaccid paralysis, with frequent heart or respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=98455071; PubMed=9783750;

Tetanus and botulinum-B neurotoxins block neurotransmitter release by
Troteolytic cleavage of synaptobrevin.";

Nature 359:832-835(1922).

L. Faranus Botulinum toxin acts by inhibiting neurotransmitter
release. It binds to peripheral neuronal synapses, is internalized
and moves by retrograde transport up the axon into the spinal cord
where it can move between postsynaptic and presynaptic neurons. It
inhibits neurotransmitter release by acting as a zinc
endopepptidase that cleaves the 76-Gln-|-Phe-77 bond of
synaptobrevin-2.

-I- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
detected action on small molecule substrates.

-I- CORACTOR: Binds 1 zinc ion per subunit (By similarity).

-I- SUBGNIT: Disulfide-linked heterodimer of a light chain (L) and a
heavy chain (H). The light chain has the pharmacological activity,
while the N- and C-terminal of the heavy chain mediate channel

-I- SUBGELLANBOUS: There are seven antigenically distinct forms of
botulinum neurotoxin: Types A, B, Cl, D, E, F, and G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This SWISS-PROT entry is copyright. -!- FUNCTION: The VP2 protein is one of the two proteins (with VP5) which constitute the virus particle outer capsid. It is the major target of the host immunogenic response.
-!- SIMILARITY: Belongs to the recoviruses VP2 protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Name=S2; Synonyms=L2;

                                                                                                                      Transference of SNAP-25 by types E and A botulinal neurotoxins.";

J. Biol. Chem. 269:1617-1620(1994).

L. PUNCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc endopeptidase that catalyzes the hydrolysis of the 180-Arg-|-11e-chaptidase that catalyzes the hydrolysis of the 180-Arg-|-11e-chaptidase that catalyzes the hydrolysis of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

FASEB J. 2:A1750-A1750(1988).

-!- FUNCTION: Botulinum toxin acts by inhibiting neurotransmitter release. It binds to peripheral neuronal synapses, is internalized and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and presynaptic neurons. It inhibits neurotransmitter release by acting as a zinc
                                                                                                                                                                                                                                                                                                                                                                                                                                                  CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No detected action on small molecule substrates.

GOPACTOR: Binds 1 zinc ion per subunit (By similarity).

SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a heavy chain (H). The light chain has the pharmacological activity, while the N- and C-terminal of the heavy chain mediate channel formation and toxin binding, respectively.

SUBCELLUAR LOCATION: Secreted.

MISCELLUAR LOCATION: Secreted.

MISCELLUAR LOCATION Secreted.

SUBCELLUAR LOCATION Secreted.

SIMILARITY: Belongs to peptidase family M27.

                                                                                                                                                                                                                                                                                                    ö
                                                                                                                              This peptide corresps. to residues 947-967 of Tetanus toxin. It can be used as a universal carrier for the prepn. of an immunogenic conjugate. It is covalently bound to a peptide or polysaccharide hapten derived from a pathogen. This conjugate can be used as a vaccine for malaria. This peptide is recognised by different T- helper cell clones in association with alleles of the human MHC. It contains 2 epitopes: (a) 953-967, recognised by DR-restricted clones; and (b) 947-960, recognised by all other DR and DP- restricted clones. (Updated on 25-MAR-2003 to correct PI field.) (Updated on 27-MUG-2003 to correct PI field.) (Updated on 24-0CT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This T-cell antigen TT3 peptide may be attached to a core peptide contained in one of the 2 subunits of an alpha-helical coiled-coil heterodiamer. Each core peptide is comprised of terminal and internal AA repeat sequences. This peptide antigen is attached to the core peptide through covalent linkages to certain AA of the internal repeats. The 2 subunits of the heterodimer are arranged in a stable alpha-helical coiled-coil configuration having a 1:1 stoichiometry, and the peptide antigen is disposed toward the outer surfaces of the configuration. The heterodimer may be used as a synthetic vaccine (optionally multivalent) or to generate antibodies
                     response against endogenous CETP activity, thereby treating or preventing a cardiovascular disease, such as atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hetero:dimeric polypeptide immunogen in coiled-coil configuration with different antigens on each sub:unit - useful in vaccines and for antibody
                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a broad range helper T cell epitope of the tetanus protein. It can be used in DNA plasmid-based vaccines against cholesteryl ester transfer proteins (CETPS). CETPS mediate the transfer of cholesteryl esters from high density lipoprotein (HDL) to very low versa. An increased CETP activity produces an atherogenic lipoprotein profile and induces atherosclerosis. A DNA plasmid-based vaccine comprises sequences encoding at least one B cell epitope of CETP linked in frame with at least one segment encoding a broad range helper T cell epitope. The vaccines can be used to elevate the ratio of circulating HDL to circulating LDL, VLDL or total cholesterol in a human. It can also be used for decreasing the level of endogenous CETP activity in a human. The transition can be used to produce anti-CETP antibodies in vivo and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
The invention relates to a new carbohydrate peptide conjugate, which comprises a carrier with a dendrimeric poly-lysine enabling multiple comprises to be covalently attached to it. Also claimed are: (1) an antibody purified from biological fluid or cells of organisms carbohydrate peptide conjugate, and (2) a diagnosis of troopprising antigen-specific antibodies elicited by immunisation with the carbohydrate peptide conjugate. The peptide conjugate, antibody and carbohydrate peptide conjugate. The peptide conjugate, antibody and carbohydrate peptide conjugate. The peptide conjugate antibody and conjugate tumours. These can be used to support an immune response against twinurs. They can be used to enhance immune responses, especially B- and reconjugate between the antibody and T-cell aresponse, of humans and animals against bacterial infections. The carbohydrate peptide conjugate stimulates the antibody and T-cell carbohydrate peptide conjugate stimulates the munians and carbohydrate sequence corresponds to residues 947-967 of tetanus town. The synthetic peptide corresponding to this sequence may be used to as an epitope in a carbohydrate peptide conjugate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Carbohydrate peptide conjugate used as vaccine - comprises carrier with dendrimeric poly-lysine enabling multiple epitopes to be covalently
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope;

be used in the method of the invention for inducing antibody-dependent cellular cytotoxicity (ADCC) against a tumour cell which is characterised by overexpression of HER 2/neu or epidermal growth factor receptor molecule (BGFR), comprises contacting the tumour cell with a multispecific protein molecule (preferably a single chain antibody) comprising; (a) an anti-FC receptor antibody or an antigen binding fragment; (b) a portion which binds to HER 2/neu; and (c) a portion which binds to BGFR. The method can be used for treating cancers especially breast cancer or ovarian cancer. The multispecific antibody can also be administered prophylactically to vaccinate a subject against infection by a target cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The claims detail a method for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers if.e. self-proteins, for example, human prostate specific membrane antigen (PSW), heregulin 2 (Her2) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous pystem of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 here! group which is foreign to the animal. Analogues of human PSW, human Her2 and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Foreign epitope, P2; prostate specific membrane antigen, PSM, Her2; Heregulin 2; Fibroblast growth factor 8b; FGF8b; vaccination; eytotoxic T-lymphocyte immunity; self-protein; cancer; breast cancer; prostate cancer; cell-associated peptide antigen.

                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                           The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a T-cell epitope peptide used to generate the chimeric peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multispecific single chain antibody; antibody H22; tumour cell; therapy; antibody-dependent cellular cytotoxicity; ADCC; HER 2/neu; infection; epidermal growth factor receptor; breast cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a tetanus toxoid epitope and is recognised by the multispecific single chain antibody designated H22. The antibody can

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a tetanus toxin T cell epitope known as Helper Peptide P30. Hybrids of this peptide and an immunogenic peptide derived from tumour rejection antigen precursor MAGE-10 were used to generate polyclonal antiserum against MAGE-10. MAGE-10 binding monoclonal antibodies can be used to detect MAGE-10. Expression. A correlation between MAGE-10 expression and cancer has been discovered and thus by determining the presence of MAGE-10, the presence of cancer can be determined. MAGE-10 expression can be detected using an immunoassay, an oligonuclectide hybridisation assay or via other standard techniques. This method is especially useful for determining the presence of bladder, ossophageal, head and neck, prostate or lung cancer, or melanoma, myeloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining presence of cancer in samples, especially useful for detecting bladder, prostate and lung cancer comprises assaying sample for expression of tumor rejection antigen precursor MAGE-10.
epitope (e.g. P2 and/or P30) are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively

The present sequence represents the tetanus toxoid P30 epitope. It is used to create a fusion protein with murine osteoprotegerin ligand (OPGL) Osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II cransmembrane protein. The murine and human OPGL polypeptides are 87% homologous. OPGL is a potent osteoclast differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast continuous of differentiation in the absence of CSF-1. OPGL is also an activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at least one OPGL analogue to induce an immune response in the animal. The method and OPGL colypeptide are useful for treating, preventing and ameliorating oblypeptide are useful for treating, preventing and ameliorating oblypeptide or subsequence of capacitics of conditions characterised by excessive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

Down-regulating interleukin 5 (IL-5) activity in humans by administering IL-5 and/or an IL-5 analogue, useful in the treatment, prophylaxis or amelioration of asthma or other chronic allergic conditions.
                                                                                                                                                                                                                                                                                                                                                                                             proteins and their coding sequences to down regulate IL-5 activity and thus reduce eosinophil numbers. The allergic diseases may be treated using autovaccines, nucleic acid vaccines or live vaccines. In addition, it is possible that they may be used in the treatment of cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Amyloid protein; neuroprotective; nootropic; immunostimulant; vaccine; Alzheimer's disease; anticonvulsant; gene therapy; Pick's disease; antidiabetic; systemic amyloidosis; maturity onset diabetes; ALS; amyctrophic lateral sclerosis; Parkinson's disease; encephalopathy; Huntington's disease; fronto-temporal dementia; P30 epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention provides carrier proteins comprising at least 5 CD4+ T cell epitope. The carrier protein comprises at least 1 of N6, N10 or N19. The carrier protein can be prepared by expressing a vector comprising a nucleic acid molecule encoding the protein, in a host cell and recovering the expressed protein. The carrier protein can also be produced by (a) constructing oligonucleotides molecules that encode peptide epitopes; (b) annealing the oligonucleotides to form duplexes; (c) introducing the duplexes into an expression vector; (d) introducing the expression vector into a host cell; and (e) isolating the fusion protein produced from a culture of the host cells. The carrier protein can be used as a protective immunogen in the control of diseases caused by encapsulated bacteria. Sequences AAY49256-266 represent CD4+ T cell epitopes inserted in the recombinant polyepitope carrier proteins

The invention relates to a method for in vivo down-regulation of amyloid protein such as beta amyloid (Abeta) in an animal, including human. The method comprising presenting to the animal's immune system an immunogenically effective amount of at least one amyloidogenic protein or its subsequence and/or at least one analogue of the amyloidogenic protein or its subsequence, and its polypeptide. The amyloidogenic protein or its subsequence, and its comprising an adjuvant for the preparation of an immunogenic composition comprising an adjuvant for down-regulating amyloid in an animal. They are also useful in the treatment, prophylaxis or amelioration of Alzheimer's disease or other diseases characterised by amyloid deposits. They are also useful in the treatment of systemic amyloidosis, maturity onset dementa, amytorophic lateral sclerosis (ALS), Pick's disease and prionrelated transmissable spongiform encephalopathies. They are also useful for inducing production of antibodies against an amyloidogenic complete.
 subsequence and/or at least one analogue of the amyloidogenic polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amyloid disease, amyloid fibril deposition, amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; escitive seystem amyloidosis; systemic senile amyloidosis; familial amyloid cardiomyopathy; transmissible spongiform encephalopathy; creutzfeld-Jakob disease; Kurh; haemodialysis-asssociated beta-2-microglobulin deposition; carrier protein; universal T-cell epitope.

The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a prognosis of amyloid component. A patient serum immunoreactivity against a component amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity of at least four times a base line serum immunoreactivity of at least four times a base line serum immunoreactivity against a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a prognosis of disorders characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by anyloid dosis associated with systemic inflammatory diseases (e.g., rheumatoid arthritis, osteomyelitis, tuberculosis) characterised by ATTR fibrils derived from serum amyloid axionyopathy characterised by fibrils derived from serum amyloid axionyopathy characterised by anyloid obsis, and beta-2-microalosis, kuru) characterised by chion protein deposits, and beta-2-microalosis, characterised by prion protein deposits, and beta-2-microalosis, characterised by prion protein deposits, and beta-2-microalosis, characterised by creating expense and pamilial amyloid dosis and earlier of long term haemodialysis treatment. The present sequence creating a universal T-cell epitope which may be used as a carrier for the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific

disease associated with amyloid deposits of amyloid precursor protein (APP) Abeta fragments in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to abeta, the antibody binds to an amyloid deposit and induces a clearing response (Foreceptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta; or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The methods are useful for prophylactic and therapeutic treatment of Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to compositions for stimulating the immune system and for treating malignancies associated with overexpression of the HBR-2 proteins. The compositions comprise immunogenic groups of the HBR-2 proteins. The present sequence is one such peptide used in the compositions of the present invention. The compositions can be used for treating cancer, e.g. breast, ovarian, lung, prostate and colon cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Compositions comprising polypeptides and polynucleotides for stimulating the immune system and for treating malignancies associated with overexpression of the HER-2 protein.
                                                    This invention describes a novel method of preventing or treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic; immune response; HER-2; human; epitope; cancer; breast;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a bispecific molecule (I) comprising specific binding sites for an Fealpha receptor and an epidermal growth factor (EGF) receptor. It also provides bispecific molecule (II) comprising a human antibody, preferably a single chain antibody, specific for an Fealpha receptor and defect for an epecific binding sites for an Fealpha receptor and a HER2 receptor; (3) a multispecific binding sites for an Fealpha receptor and a HER2 receptor; (3) a receptor, HER2 receptor and EGF receptor; (4) a multispecific molecule (IV) comprising specific binding sites for Fealpha receptor, and receptor, and receptor, and receptor and EGF receptor, (4) a multispecific molecule (V) comprising a human antibody specific for an Fealpha receptor, a human antibody specific for an EGF. (I)-(V) can be used for inducing effector cell killing of tumour cells. The molecules can be used to treat or revent viral, protezoal, or fungal infections, or autoimmune diseases such as immune thrombocytopenia purpura and systemic lupus erythemmans.
                                                                                                                                                                                                                                                                                                                             Fcalpha receptor; epidermal growth factor; EGF; HER2 receptor; tumour; immune thromboortopenia purpura; systemic lupus erythematosus; vaccine; cytostatic; antivital; protozoacide; antifungal; immunosuppressive; antiinflammatory; dermatological; hemostatic; tetanus toxoid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bispecific molecule comprising specific binding sites for an Fc-alpha receptor and an epidermal growth factor, used to induce effector cell killing of tumor cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is that of the promiscuous tetanus toxic T-cell epitope P30. It is an object of the invention to produce a recombinant therapeutic vaccine capable of effecting down-regulation of growth differentiation factor 8 (GDF-8) in order to increase the muscle growth differentiation factor 8 (GDF-8) in order to increase the muscle growth care capable of breaking autocolerance against autoclogous GDF-8.

These comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as the comprise the C-terminal region limits the possible sites in which the T-cell epitope can be positioned without major disturbance of the comprise and positioned without major disturbance of the animals. Down-companies and poultry can increase muscle mass by up to at least companies in pigs and poultry used for meat production, reducing the companies of pigs and poultry used for meat production, reducing the companies of the animals. Down-companies and poultry used for meat production, reducing the companies such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.

The invention relates to a new method for inducing killing of a tumor cell which expresses HER 2/neu or epidermal growth factor receptor teGER). The method comprises contacting the tumor cell with a multiapecific protein comprising a component, preferably an antibody, which binds to an Pc receptor (PcR), Her 2/neu or EGFR. The method is useful for inducing killing of a tumor cell from breast cancer, sarcoma, carcinoma, or ovarian cancer. Specific multispecific proteins can also be administered to a subject to treat or prevent other diseases or conditions, including pathogenic infections (e.g., viral (such as HIV)), protozoan infections (such as Toxoplasma gondii), fungal infections (such as candidlasis), and an autoimmunity (e.g. immune thrombocytopenia purpura and systemic lupus). The present sequence represents an universal tetanus toxin Th epitope TT947-967
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Multivalent protein; immune response; Plasmodium vivax; parasite; protozoacide; vaccine; malaria; recombinant; ViVac1; ViVac2.

The invention relates to an immunogen comprising at least one first antigenic determinant that includes at least one B-cell epitope and/or at least one eyctoxic Tlymphocyte (CTL) epitope, and at least one second antigenic determinant that includes a T helper cell epitope (TH epitope), where each of the first and second antigenic determinants are coupled to an activated polyhdroxypolymer carrier. The invention also relates to an immunogenic composition for raising an immunogen or immunogenic composition in a mammal, including a human. The immunogen or immunogenic composition contained in a virtual lymph node (VLN) device is useful for immunising an animal, including a human, against an antigen of choice, where the antigen shares at least one first antigenic determinant with the immunogen. This sequence represents a T helper cell epitope used in synthesis of an immunogen of the invention
                                                                                                                                                                                                                                                    Novel immunogen useful for immunizing an animal, has an activated polyhydroxypolymer backbone to which is attached an antigenic determinant including a B cell epitope and another determinant including a T-helper
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gonadotrophin releasing hormone; GnRH; synthetic immunogen;
luteinising hormone releasing hormone; LHRH; contraceptive;
promiscuous helper T-cell peptide epitope; immunomimic peptide epitope;
breast cancer; uterine cancer; gynaecological cancer; endometriosis;
uterine fibroid; benign prostatic hypertrophy; prostate cancer;
Tetanus toxoid precursor peptide; tentoxylysin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tetanus toxoid precursor peptide, tentoxylysin, #2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to recombinant multivalent proteins (I) that
stimulate an immune response to Plasmodium vivax. (I) comprises antigenic
determinants, fragments or conservative substitutions, derived from more
than one stage in a life cycle of a Plasmodium vivax parasite. (I) is
c useful as a vaccine for stimulating an immune response, specifically a
protective immune response that confers increased resistance to infection
by Plasmodium parasites, such as P. vivax. (I) is especially useful in
the treatment, prevention and reduction of malarial infection, as
c the treatment, prevention and reduction of malarial infection, so
c the treatment of supple, and for conferring immunity against multiple
c stages of the malarial parasite. The antibodies produced are useful for
the detection or measurement of antigenic epitopes derived from one or
c more stages in a life cycle of a parasite, particularly P. vivax. The
c vaccine comprising the recombinant proteins, is cost-effective, health-
c promoting intervention for controlling, preventing or treating the
c incidence of malaria. The present sequence represents the amino acid
c sequence of a P30 epitope, a component of the multivalent and multistage
c proteins vivaclp and vivac2p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                         New recombinant multivalent protein comprising antigenic determinants derived from more than one stage in a life cycle of Plasmodium vivax, useful as a vaccine for treating, preventing and reducing malarial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                         The invention relates to a synthetic immunogen for inducing specific antibodies against gonadotropin releasing hormone (GRRH also known as luteinishing hormone releasing hormone, LHRH; comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GRRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other synaecological cancer, prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody titres. The present sequence is Tetanus toxoid precursor peptide, tentoxylysin, a promiscuous helper T-cell peptide epitope used in the immunogen of the invention
                                                                                      gonadotropin releasing hormone, comprises fusion peptide having
promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel analog of amyloid precursor protein or beta amyloid for treating Alzhaimer's disease, has amyloid precursor protein/beta amyloid incorporating B-cell epitope of amyloid protein and foreign T-helper epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tetanus toxoid; epitope; amyloid precursor protein; APP; beta amyloid; vaccine; genetic immunisation; nootropic; neuroprotective; Alzheimer's disease.

                        epitope P30. Targetion provides methods for compositions for combatting diseases characterised by deposition of amyloid, such as Alzheimer's disease. Immunisation is preferrably effected by administration of analogues of autologous amyloid precursor protein (APP) or beta amyloid (Abeta), the analogues being capable of inducing antibody production against the autologous amyloidogenic polypeptides. Especially preferred as an immunogen is autologous Abeta which has been modified by introduction of one or a few foreign, immunodominant and promiscuous Teell epitopes, such as tetanus toxoid P30 epitope. Genetic immunisation against APP or Abeta and vaccination using live vaccines are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) infection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of a Clostridium tetani T-cell epitope #4.
The present sequence is the protein sequence of tetanus toxoid T-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least 1 modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a tetanus toxoid (TT) P30 epitope that can be introduced into a CEA polypeptide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWF, TWFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a tetanus toxoid epitope peptide. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 σ
                                                                                                                                                                                                                                                                         Multimeric protein; interleukin 5; IL5; TNPalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; epitope;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                    ò
                                                                                                                                                               The present sequence is that of a universal T-cell epitope comprising amino acids 947-967 of teranus toxoid. Universal T-cell epitopes such as this can be used as carriers of peptide agents of the invention that bind alpha-4 integrin or a dimer comprising an alpha-4 integrin subunit.

Linkage to a carrier will improve the immune response to a peptide that may be too small to be immunogenic on its own. A method of Ghronically comprising a patient's pathological inflammation involves administration of an agent that specifically binds to an alpha-4 integrin or a dimer comprising alpha-4 integrin. The agent is administration and anintains alpha-4 integrin receptor saturation to chronically suppress pathological inflammation in the patient. The pathological inflammation in the patient. The pathological inflammation is caused by inflammatory disease of the gastrointestinal tract, such as Crohn's disease, ulcerative collisis or inflammatory bowel disease, or is caused by multiple sclerosis (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                     Preventing and/or reducing pathological inflammation by administration of an agent inhibiting alpha-4 integrin or its dimer, useful in treating multiple sclerosis, Crohn's disease, ulcerative colitis or inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first

                                                                                                                                                           The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a reall epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against nontypable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTH to host cells thereby preventing or reducing the severity of otitis media. The present sequence is a clostridium tetani T cell epitope for use in the chimaeric peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for reducing pain or increasing the threshold for nociception in an individual comprising administering an agent capable of inducing an active immune response that trargets the individual's autologous tumour necrosis factor alpha (TNFalpha). The agent has analgesic activity, and can be used in a vaccine against autologous TNFalpha. The method is useful in reducing pain or increasing the threshold for nociception in individual. The method is especially intended for reducing neuropathic pain. The present sequence represents
peptide unit and third linker reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Reducing pain or increasing the threshold for nociception in an individual comprises administering an agent capable of inducing an activimmune response that targets the individual's autologous tumor necrosis

The invention relates to a process for selecting ligands (A) of HLA with a labelled peptide (I) in presence of different concentrations of test compounds; (b) separating complexes formed; (c) determining DP4-(I) cemplexes by measuring a signal from the label; and (d) selecting complexes by measuring a signal from the label; and (d) selecting compounds having binding ICSO less than 1000 nM, corresponding to the concentration required to inhibit 50 % binding of (I). (I) has signal-to-noise ratio over 5, at 10 nM, in a direct binding test to DP4. (A) cause concentration over 5, at 10 nM, in a direct binding test to DP4. (A) cause them, are useful as immunomodulators, including uses in vaccines against pathogens and tumor cells, also for treating autoimmune diseases (multiple sclerosis and type I diabetes), allergy and graft rejection. (A) are useful as reagents for diagnosing the immune status of an individual, while labelled complexes of DP4 with (A) are used to select antigen-specific CD4+ T cells. The method identifies ligands specific for HLA-DP4 and allows exact definition of the binding motif shared by DP4 chinding ligands. This sequence represents an example of a peptide ligand of the invention. The peptides are labelled (biotinylated) at their N-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to antigenic peptides derived from tumour suppressor protein WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes. The peptides can be used in the preparation of cancer vaccine for treatment and prevention of cancer, including leukaemia, multiple myeloma, lymphoma, and cancer of the stomach, colon, breast, liver, ovary, skin, pancreas, prostate and womb. The present sequence is a polypeptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antigenic peptides derived from WT1 which induce HLA-A24 restricted cytotoxic T-lymphocytes for production of cancer vaccine and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This invention relates to a novel immunogenic composition comprising an In-13 (interleukin-13) element that is capable of driving an immune response by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 capanences as having a similar conformational shape to native human IL-13 capanence as having a similar conformational shape to native human IL-13 capanence as having a similar conformational shape to native human IL-13 capanence and manial species, to enhance its immunogenicity. Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the method results in a reduction in airway hyper-responsiveness (AHR). The airways and skin irritation, as well as reducing the requirement for inhaled corticostercides (ICS). As such, these compositions, which exhibit corticostercides (ICS). As such, these compositions, which exhibit to treat individuals suffering from or susceptible to chronic obstructive confinence is a T-cell peptide epitope fused to IL-13 to create an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel immunogenic composition comprising an IL-13 (interleukin-13) element that is capable of driving an immune serponse by recognising human IL-13 and one or more foreign T-cell epitopes. Specifically, it refers to a method for producing a human chimeric IL-13 immunogen formulated in an appropriate manner to generate a human vaccine. The present invention describes human chimeric IL-13 sequences as having a similar conformational shape to native human IL-13 sequences as having sufficient amino acid sequence diversity, attributable to non-human mammalian species, to enhance its immunogenicity. Accordingly, the method results in a reduction in airway hyper-responsiveness (AHR), the airways and skin irritation, as well as reducing the requirement for inhaled cotticosteroids (ICS). As such, these compositions, which exhibit dermatological and antiasthmatic activities, can be used via gene therapy to treat individuals suffering from or susceptible to chronic obstructive pulmonary disease (COPD), asthma or atopic dermatitis. This peptide summer of a summer of an interest an expectation of a sequence is a T-cell peptide epitope fused to IL-13 to create an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a vaccine composition for treating asthma or COPD (chronic obstructive pulmonary disease). The vaccine composition comprises an immunogen that is capable of generating an immune response against self interleukin-13 [L-13) and an adjuvant composition comprising a combination of an immunostimulatory oligonucleotide containing at least one unmethylated CG motif and a saponin. The IL-13 immunogen is preferably a human IL-13 supplemented with foreign T-helper epitopes, or is a non-human IL-13 backbone substituted with human IL-13 epitopes. The vaccine composition is useful for treating asthma or COPD, or atopic disorders such as hayfever, contact allexgies or dermatitis. The present sequence represents a heterologous T-cell epitope which may be incorporated into an IL-13 immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ghrelin, autologous ghrelin, ghrelin analogue, immunogen, immunisation, anti-ghrelin antibody, obesity, anorexia, cachexia, wound, burn, adjuvant therapy, in vitro fertilisation; ghrelin-related cancer, ghrelin receptor-related cancer, anorectic, cytostatic, metabolic, immunomodulator; vulnerary; vaccine, tetanus toxin, P30 epitope,

the invention relates to a method for immunising animals (including humans) against autologous ghrelin. The method involves presenting ghrelin (or sub-sequence thereof) or a ghrelin analogue comprising a ghrelin becell epitope and non-ghrelin chemical moieties to the immune system, thereby inducing the production of antibodies against the compositions comprisitions comprising ghrelin, a ghrelin sub-sequence or a ghrelin analogue of the invention; a nucleic acid encoding a ghrelin analogue of the invention; a motelic acid encoding a ghrelin analogue of the invention; a modified ghrelin polypeptide capable of inducing antibodies against unmodified autologous ghrelin; and use of immunogenic compositions of the invention. The method of the invention is useful for treating, preventing or ameliorating obesity or other conditions of characterised by excess body fat deposits by downregulating ghrelin to such an extent that the total amount of body fat is significantly decreased. The method may also be used for upregulating ghrelin for the treatment, prevention or amelloration of anorexia or cacharin. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      may also be used for treating wound or burns, in adjuvant therapy for in vitro fertitilisation, and for treating opterlin and ghrelin-receptor related cancers. The present sequence represents the tetanus toxin P30 epitope, a promiscuous T-cell epitope, which may be used in ghrelin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                       Immunizing against autologous ghrelin in animals e.g. human beings, useful for treating obesity, by presenting ghrelin polypeptide, its subsequence or analog, to animal's immune system, for producing antibodies against ghrelin

cysteine residue is substituted with another anim acid residue. The WTI substitution peptides have CTL induction activity. Peptides of the invention are used in cancer vaccines, which are applicable in the treatment of e.g. stomach cancer, prostate cancer and ovarian cancer. The present peptide represents a peptide that is mentioned in the
                                                                                                                                                                     Novel WTI substitution peptides with cysteine replaced by specific amino acid residue and their encoded polynucleotide for cancer vaccines with CTL induction activity for treatment of e.g. stomach cancer and prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing or treating disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in brain by administering agent that induces immunogenic response against alpha-synuclein and/or beta-amyloid.
                                                                                                                  Nakatsuka M;
                                                                                                                                                                                                                                                                       specification describes WT1 substitution peptides, in which a

                                            The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to amino acids 947-967 of the tetamus toxoid protein used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. The intention features to a method of synthesizing dismostratives of a carbohydrate dendrimer (CD) conjugate having a specific structure

C residue of an immunomodulating substance. (CD) is useful in the

production of antibodies, as a trageting compound, in medicine, in

inhibition of bacterial adhesion, inhibition of toxin action such as e.g.

Glycosphingolipid-specific VTZ toxins and other such bacterial toxins

with binding activities toward cell-surface carbohydrates of the host, or

inhibition of carbohydrate-mediated virus entry into host cells, in

diagnostic assays, in assays for the detection of antibodies against E,

and in high-throughput screening. (CD) are useful for treating and/or

preventing bacterial diseases such as e.g. infection with bacteria, viral

diseases such as infection with HIV, hepatitis or influenza, fungal

diseases and certain types of cancer such as carcinomas or melanomas. The

method enables fast and efficient synthesis of dendrimer conjugates

having a well-defined chemical structure. This sequence corresponds to a
                                                                                                                                                                                                                                                             ö
against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to the tetanus toxoid peptide corresponding to amino acid 947-967 used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibacterial; virucide; fungicide; hepatotropic; anti-HIV; cytostatic; vacchis; bacterial adhesion inhibitor; toxin action inhibitor; carbohydrate dendrimer; immunomodulating substance; HIV; hepatitis; influenza; fungal disease; cancer; carcinoma; melanoma; poliovirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthesizing chemoselectively carbohydrate dendrimer conjugate having carbohydrate residue and immunomodulating substance, by identifying chemoselective and carbohydrate residue, and binding residues to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel method of generating a population of reclls specific for an antigen comprising isolating a population of substantially marure antigen presenting cells (APC), co-incubating the substantially marure APC population with a population of CD4+ T-cells and a target antigen for a time and under conditions sufficient to generate CD5+ T-cells specific for the antigen. The method of the invention has virucide, antibacterial, protozoacide, and cytostatic activity, and may have a use in cell therapy. The present sequence represents tetanus toxoid p30 peptide (t1947-967).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Generating a population of T-cells specific for an antigen comprises co-
incubating the substantially mature APC population with a population of
CD4+ T-cells, a population of CDS+ T-cells and a target antigen.
                                                                                                                                                                                                                                                                                                                                      T-cell; antigen; antigen presenting cell; APC; CD4+; CDS+; virucide; antibacterial; protozoacide; cytostatic; cell therapy; tetanus toxoid;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                      Gaps
tetanus toxoid peptide sequence used in the method of the invention.
                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel chimeric binding protein that is immunogenic in an animal. The chieric binding protein binds specifically to a first receptor that binds a second receptor present in an antigen of the animal, where the chimeric binding protein structure, autologous in the form of a binding site; a scaffold protein structure, autologous in the mammal, that stabilizes the 3D conformation of the binding site; and at least one tolerance breaking amino acid sequence, which is the terologous in the animal and which binds to a major histocompatibility comprises: a nucleic acid fragment that encodes the chimeric binding protein; a vector carrying the nucleic acid fragment; a transformed cell carrying the vector; a composition for inducing production of antibodies gaining an antigen in the autologous host comprising the chimeric binding protein, nucleic acid fragment and a carrier, and down-regulating a selfantigen or a cell that displays epitopes of the self-antigen in an animal. The chimeric binding protein has cytostatic activity. The chimeric binding protein is useful in preparing a vaccine against e.g. epitope peptide for use in the vaccine of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New chimeric binding protein comprising a B-cell epitope, a scaffold protein structure and a tolerance breaking amino acid sequence, useful in

This invention relates to novel mutant peptides derived from SYT-SSX. Specifically, it refers to a peptide SS393, which is a modified tumour antigen peptide that can be used as the active ingredient in a cancer vaccine. The present invention describes the development of mutant peptides that exhibit increased binding affinity to the HLA-A24 antigen, and as such have a favourable cytotoxic lymphocyte (CTL) induction activity. Accordingly, these peptide epitopes can be used to treat patients suffering from various tumours including synovial sarcoma, and furthermore they exhibit cytostatic activities. This peptide sequence is a helper peptide derived from the tetamus toxin, given in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Amyloid deposit; APP; Abeta; brain; human; clearing response; nootropic; Fc receptor mediated phagocytosis; immunogenic response; neuroprotective; amyloid precursor protein; Alzheimer's disease.

This invention describes a novel method of preventing or treating a disease associated with amyloid deposits of amyloid precursor protein ARPP Meta framents in the brain of a patient, which comprises administering to the patient: (a) an antibody that binds to Abeta, the antibody binds to an amyloid deposit and induces a clearing response (For receptor mediated phagocytosis) against it (b) a polypeptide containing an N-terminal segment of at least residues 1-5 of Abeta, or (c) an agent that induces an immunogenic response against residues 1-3 to 7-11 of Abeta. The products of the invention have nootropic and neuroprotective activity. The method is also useful for monitoring a course of treatment being administered to a patient e.g. active and passive immunization. The Alzheimer's disease
                                                                                                                                                   Preventing or treating a disease associated with amyloid deposits, especially Alzheimer's disease, comprises administering amyloid specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Preventing or treating disease such as Parkinson's disease characterized

The invention relates to a method of preventing (M1) or treating a disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (M1) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a fusion peptide used in the method of the invention. Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. lies or alpha-synuclein aggregation in brain by administering induces immunogenic response against alpha-synuclein and/or Foreign epitope, P2; prostate specific membrane antigen; vaccination; cytotoxic T-lymphocyte immunity; self-protein; cancer; breast cancer; prostate cancer; cell-associated peptide antigen. ```
AAY92650-55 are peptides designed which correspond to the P2 and P30
cpitopes with 5 flanking human prostate specific membrane antigen (hPSM)
amino acids in each end. The flanking amino acids correspond to the
cpitope insertion sites 6, 8 and 10. The peptides will be used in, e.g.
The claims detemin a method for inducing immune responses against weakly
immunogenic cell-associated peptide antigens (PA) such as those
associated with cancers (i.e. self-proteins), for example, hPSM,
cassociated with cancers (i.e. self-proteins), for example, hPSM,
comprises effecting simultaneous presentation by antigen producing cells
comprises effecting simultaneous presentation by antigen producing cells
(APCs) of the animals immune system of: (1) at least 1 CTL (cyctoxic T-
lymphocyte) group derived from the PA and/or at least 1 first T helper
cell group which is foreign to the animal. Analogues of human PSM, human.
Herz and human/murine PGP8b comprising a substantial part of all known
at least one foreign the plitopes of the respective PA and including
at least one foreign the plotopes (e.g. p2 and/or P30) are also
claimed. The method is used to treat prostate, prostate/breast or breast
cancer when the PA is human PSM, FGP8b and Herz, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92650-55 are peptides designed which correspond to the P2 and P30
epitopes with 5 flanking human prostate specific membrane antigen (hPSM)
anino acids in each end. The flanking amino acids correspond to the
epitope insertion sites 6, 8 and 10. The peptides will be used in, e.g.
cell proliferation sites 6, 8 and 10. The peptides will be used in, e.g.
The claims detail a method for inducing immune responses against weakly
immunogenic cell-associated peptide antigens (PA) such as those
associated with cancers (i.e. self-proteins), for example, hPSM,
cassociated with cancers (i.e. self-proteins), for example, hPSM,
comprises effecting simultaneous presentation by antigen producing cells
(APCS) of the animals immune system of: (l) at least 1 GTL (cyctoxxic T-
lymphocyte) group derived from the PA and/or at least 1 first T helper
cell group which is foreign to the animal. Analogues of human PSM, human
Herz and human/murine FGRBb comprising a substantial part of all known
at least one foreign the helper periopes of the respective PA and including
at least one foreign the helper epitope (e.g. P2 and/or P30) are also
claimed. The method is used to treat prostate, prostate/breast or breast
cancer when the PA is human PSM, FGRBb and Herz, respectively

AAY92650-55 are peptides designed which correspond to the P2 and P30
cpitopes with 5 flanking human prostate specific membrane antigen (hPSM)
amino acids in each end. The flanking amino acids correspond to the
cpitope insertion sites 6, 8 and 10. The peptides will be used in, e.g. T
cell proliferation assays, but also for ELISA or other in vitro assays.

CC flacials decail a method for inducing immune responses against weakly
immunogenic cell-associated peptide antigens (PA) such as those
associated with cancers (i.e. self-proteins), for example, hPSM,
comprises effecting simultaneous presentation by antigen producing cells
comprises effecting simultaneous presentation by antigen producing cells
(APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-
lymphocyte) group derived from the PA and/or at least 1 first T helper
cell group which is foreign to the animal. Analogues of human PSM, human
Herz and human/murine PGP8b comprising a substantial part of all known
and predicted CTL and B-cell epitopes (e.g. P2 and/or P30) are also
claimed. The method is used to treat prostate, prostate/breast or breast
call amen the PA is human PSM, FGF8b and Herz, respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vaccine, LHRH; luteinising hormone releasing hormone; prostate; androgen-dependent carcinoma; antitumour; infertility; tetanus toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Helper T cell epitope; universal immune stimulator; invasin; hapten;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Immunogenic luteinising hormone releasing hormone peptide(s) - that suppress LHRH activity in males and females.

Synthetic immunogenic peptides are provided in which a universal immune stimulator is linked to a peptide or protein hapten containing B cell and/or cytotoxic T lymphocyte epitopes, giving a product which causes potent immune responses to the coupled peptide or protein. The stimulator consists of (A) a promiscuous helper T cell epitope (Th) which elicits an immune response to the coupled peptide in members of a heterogeneous population expressing diverse HLA phenotypes, and (B) an adjuvant peptide sequence from the invasin protein of Yersinia. Spacer amino acid comains and between the immune stimulator and hapten components. When the hapten is LHRH, then optionally the invasin domain can be omitted from the immune stimulator component. The present sequence represents an LHRH.

Containing, invasin-free immunogenic peptide as above which can be used as a potent vaccine for treating e.g. prostatic hyperplasia, androgence dependent carcinoma, prostatic carcinoma, testicular carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, carcinoma, cancer or for induction of infertility.                                                The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits (amyloid plaques) in a patient. The pharmaceutical composition comprises an agent that will induce an immune response against an amyloid component, or an antibody or antibody fragment that binds to an amyloid component. The invention also relates to a method for determining the prognosis of a patient undergoing treatment for an amyloid disorder which involves measuring a patient serum amount of immunoreactivity against a selected amyloid component. A patient serum immunoreactivity of at least four times a base line serum immunoreactivity control level indicates a prognosis of improved status with respect to the disorder. The pharmaceutical compositions of the invention are useful for treating a vide variety of disorders characterised by amyloid fibril deposition in a patient. Such disorders include Alahaimer's disease characterised by amyloid beta peptide fibril deposits; type 2 diabetes characterised by amyloid beta peptide fibril deposits; tuberculosis) characterised by Antibring derived from serum amyloid A protein (ApoSA); systemic semile amyloid serum amyloid A protein (ApoSA); systemic semile amyloid serum amyloid A protein (ApoSA); systemic semile amyloid serum amyloid A protein (ApoSA); systemic semile amyloid serum amyloid A protein (ApoSA); systemic semile amyloid serum haemodialysis treatment. The present sequence compeptide fused to a universal T-cell epitope which may be used in a composition to treat or prevent Alahaimer's disease. (Updated on 11-SEP-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a synthetic immunogen for inducing specific antibodies against gonadorropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epicope and immunomimic peptide epicope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometricais, uterine fibroids, benign prostate thypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells centration call induction of differentiation of dendritic cells, induction of differentiation of dendritic cells, induction of differentiation of maturation of immunocompetent cell strains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or targeting). The pseudopeptides are thus useful in human or veterinary medicine as immuniting or are thus useful in human or veterinary medicine as immuniting or covalently bonded to) antigens for vaccination against viral, corovalently bonded to) antigens for vaccination against viral, calls ex vivo, to render the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune diseases. The pseudopeptides are useful as carriers for antigens or other therapeutic agents due to their ability to form non-covalent bonds via the hydropholic or hydrophilic auxiliary spacer. The present sequence represents a peptide, which has 5 possible conjugation sites for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New amphiphilic acylated pseudopeptides having a functionalized auxiliary spacer, useful as immunomodulators, e.g. as adjuvants in vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pseudopeptide; immunomodulation; adjuvant; antigen presenting cell; macrophage; dendritic cell; cytokine production; immunocompetent cell; autoimmune disease.

The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells (e.g. macrophages or dendritic cells), induction of differentiation of dendritic cells, induction of cytokine production of differentiation of maturation of immunocompetent cell strains originating from hematopocitic maturation of immunocompetent cell strains originating from hematopocitic or on lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or trageting). The pseudopeptides correction as immunizing or diagnostic agents. Typically, the pseudopeptides are used as adjuvants together with (or covalently bonded to) antigens for vaccination against viral, parasitic/protozoal, microbial or fungal infections; incubated with blood cells ex vivo, to render the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune constrains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preventing or treating disease such as Parkinson's disease characterized

ö
the brain, by administering an agent that induces an immunogenic response against alpha-synuclein and/or beta-amyloid (Abeta) to a patient. (MI) is useful for preventing or treating a disease such as Parkinson's disease characterized by Lewy bodies or alpha-synuclein aggregation in the brain, which involves administering agent that induces immunogenic response against alpha-synuclein and/or Abeta to a patient, and the administration improves motor characteristics of the patient. Alpha-synuclein or Abeta is useful in the manufacture of a preparation for simultaneous, separate or sequential treatment of disease characterized by Lewy bodies or alphasynuclein aggregation. This sequence corresponds to a linear fusion of the tetanus toxoid peptide corresponding to amino acid 830-844 and 947-967 used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel synthetic immunogen for inducing immune response against gonadotropin releasing hormone, comprises fusion peptide having promiscuous helper T-cell peptide epitope and immunomimic peptide epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gonadotrophin releasing hormone; GnRH; synthetic immunogen;

                                                         The invention relates to a synthetic immunogen for inducing specific antibodies against gonadotropin releasing hormone (GnRH also known as luteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody titres. The present sequence is a synthetic immunogen of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Amyloid disease; amyloid fibril deposition; amyloid plaque; immunogenic; antibody; vaccine; Alzheimer's disease; type 2 diabetes; reactive system amyloidosis; systemic senile amyloidosis; familial amyloid cardiomyopathy; transmissible spongiform encephalopathy; Creutzfeld-Jakob disease; Kuru; haemodialysis-asssociated beta-2-microglobulin deposition; amyloid beta peptide; universal T-cell epitope; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition for preventing or treating a disease characterised by amyloid fibril deposits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pharmaceutical composition comprising immunogen against amyloid component such as fibril peptide or protein, or antibody against amyloid component useful for treating amyloid diseases or amyloidoses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amyloid beta/tetanus toxoid immunogenic fusion peptide, SEQ ID NO:12.
                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                  ö
